Important Programming Questions - CSUL201

1. Define a student class with attributes name, rollNumber, and marks. Implement methods to set and display student details.

2. Implement a Circle class with a constructor that initializes radius and a method to calculate area.

3. Implement a Person class with private attributes name and age. Use public methods to set and get values.

4. Create a Bank class with a static function to display the bank's interest rate.

5. Define a BankAccount class with attributes accountNumber, holderName, and balance. Implement methods for deposit and withdrawal.

6. Create a Point class with x and y coordinates. Implement a default constructor and a parameterized constructor.

7. Create a Mobile class with multiple constructors, including a copy constructor.

8. Implement a Book class where the title attribute is private, and a member function updates it.

9. Create a Circle class with an inline function to return the circumference.

10. Define a Distance class and write a function that takes two objects and returns the sum of distances.

11. Design a Circle class with a radius attribute and member functions to calculate area and circumference.

12. Define a Laptop class with attributes like brand, processor, and RAM. Use a parameterized constructor to initialize attributes.

13. Develop a ComplexNumber class with real and imaginary parts as attributes. Implement a method to add two complex numbers.

14. Design a Car class with a copy constructor to copy details from another object.

15. Create a Time class with hours, minutes, and seconds as attributes. Implement a method to add

two Time objects.

16. Implement a Rectangle class with a parameterized constructor to initialize length and breadth.

17. Create a Student class with a private member marks and a function to modify it using a friend method.

18. Implement a Company class with a static member function to print company policies.

19. Define two classes Car and Bike. Implement a friend function that compares their speeds.

20. Create a Shape class with protected attributes and implement a derived class Circle to access them.

21. Implement a Distance class with private attributes and use a friend function to add two distances.

22. Create a Book class with attributes title, author, and price. Write a program to create objects of this class and display book details.
